# Remote SAS Configuration for OC 4.0.2

CLINICALSERVER.COM
**DBMS Consulting, Inc.**

## NT or Unix Backend

**OC Database Instance using Oracle Server 8.1.6.3.x**

DBMS_PIPE

**.cshrc or .profile**

.cshrc or .profile file must contain a reference to path that can resolve the exact term sas since this is how OC generates its files to create sas views (.ssv01). A centrally called environment file from .cshrc can be used here via a test command within the users' .cshrc to allow execution only when a user logs into an OC Server.

$RXC_SAS_VIEW contains the .sas and .ssv01 files generated from OC.

**Parameterized Submission (PSUB) Daemon**

**SAS_VIEW: SAS Data Extract Views and Datasets**

tnsnames.ora entry for OC database

**sas**

A commonly located shell script (e.g. /usr/bin) called sas must set $SASDIR and call sas on the SAS server via remsh command.

## SAS UNIX Server Machine

VMS is no longer supported.

**SAS Programs, Datasets and Reports**

Another shell script can be created which contains the path for the SAS 6.12 binary coded $ORACLE_HOME and $SAS_WORK_DIR.

**NFS Shared $RXC_SAS_VIEW**

SQL*Net/Net*8 to resolve OC instance names on SAS Server

**SAS/ACCESS for Oracle Required**

**SAS 6.12**

**NFS Shared $RXC_LOG**

Either /etc/hosts.equiv or .rhost for each user must allow access to the SAS server for each OC userid running SAS jobs.

### LEGEND
